Convex Polytopes

All polytopes (polyhedra) here are assumed to be *convex*.

- **LA61.** Prove that every face of a polytope *P* is contained in a facet (of codim 1).
- **LA62.** Determine the faces of the *n*-simplex.
- **LA63.** Given a 3-dimensional polytope such that every two vertices are adjacent, show that it is a tetrahedron.
- **LA6** \diamond **4.** Describe (in coordinates) the faces of the intersection of the *n*-dimensional cube $P = \{0 \le x_k \le 1 \mid k = 1, ..., n\}$ with the hyperplane $x_1 + ... + x_n = \frac{n}{2}$.
- **LA6** \diamond **5.** Prove that the convex hull of any set of points that are in *general position* in \mathbb{R}^d (there are no d+1 points in one hyperplane) is a *simplicial* polytope, i.e. all of whose proper faces are simplices.
- **LA6** \diamond **6.** Show that if a polytope is both *simple* (a polytope in \mathbb{R}^d is simple if every vertex belongs to exactly d facets) and simplicial, then it is a simplex or an n-gon.
- **LA6?.** Show that every polytope is affinely isomorphic to a bounded intersection of an orthant with an affine subspace.
